

## Set Retarding Admixture

### Overview

With set retarding admixtures, Hilltop Companies control setting characteristics and allow full-form deflection to take place before concrete sets.

### Benefits

Set retarding admixtures offer superior finishing characteristics for flatwork and cast surfaces. These admixtures help eliminate cold joints and increase compressive and flexural strengths.

### Technical Specifications

Hilltop Companies use set retarding admixtures that meet ASTM C 494/C 494M requirements for Type B, retarding, and Type D, water-reducing and retarding, admixtures.

### Uses

Set retarding admixtures are often used in prestressed, precast, reinforced, lightweight, pumped, pervious and self-consolidating concrete.
